WILLIAM J. BICKNELL, M. D.
COMMISSIONER

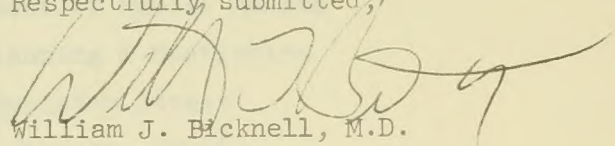

June 1, 1974

To The Honorable Senate and
House of Representatives

I have the honor to submit herewith, as required by Chapter 111, section 2, of the General Laws, the one hundred and thirtieth Annual Report on statistics of births, deaths, marriages, and divorces, in Massachusetts for the calendar year 1971.

In accordance with Chapter 508, Acts of 1964, this is the eighth Annual Report of Vital Statistics published by the Department of Public Health, and is intended for administrative and research purposes connected with health programs and population studies.

Respectfully submitted,

William J. Bicknell, M.D.
Commissioner

THE COMMONWEALTH OF MASSACHUSETTS

DEPARTMENT OF PUBLIC HEALTH

William J. Bicknell, M.D.

Commissioner

Annual Report

of

Vital Statistics of Massachusetts

(Births, Deaths, Marriages, and Divorces)

For the Year Ending December 31, 1971

Prepared by the

Introduction

This is the eighth Annual Report of Vital Statistics prepared by the Department of Public Health. It tabulates Massachusetts births, deaths, marriages and divorces, occurring in the 1971 calendar year.

As in previous reports, the tabulations are based primarily on residence rather than on occurrence information. However, marriages, divorces and fetal deaths that involve Massachusetts residents and that occurred outside the Commonwealth are not included.

Questions concerning these data and requests for more detailed findings should be sent to the Office of Health Planning and Statistics, Massachusetts Department of Public Health, Room 328 80 Boylston Street, Boston, Massachusetts 02116.
Telephone: Area Code 617, 727-8960

Definitions

Residence is defined as that of the deceased for a death and that of the mother for a birth or fetal death. Residents from other states who have lived in Massachusetts for more than one year are considered residents of this state, except in those cases of deaths within resident institutions, regardless of the length of stay within the institution. Former residents of Massachusetts who have been absent more than one year are no longer considered residents of this state.

Immature birth is considered as one for which the birth weight is 2,500 grams (5 pounds 8 ounces) or less, regardless of the period of gestation.

Infant death is considered as the death of a child under one year of age.

Neonatal death is considered as the death of a child occurring during the first twenty-eight days of life.

Fetal death is the death of the product of conception prior to the complete expulsion or extraction from its mother, irrespective of the duration of the pregnancy. The death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Findings in this report are for reported fetal deaths of 20 weeks gestation or more.

Underlying cause of death is defined as the disease or injury which initiated the sequence of morbid events leading directly to death or the circumstances of the accident or violence which produced the fatal injury. The responsibility for indicating the underlying cause of death is that of the certifying physician or medical examiner.

Rates

Infant mortality rate (Table 2) is expressed as the number of deaths of infants, i.e., children less than one year of age, per 1000 live births.

Neonatal death rate (Table 2) is expressed as the number of deaths occurring within the first 28 days of life per 1000 live births.

Fetal death rate (Tables 16,17,18) is expressed as the number of fetal deaths occurring per 1000 live births and fetal deaths. This purports to indicate the rate of unsuccessful pregnancies, although a slight error is inherent, because no abortions or miscarriages of fetuses less than 20 weeks gestation are reported. It should be noted here that fetal deaths are most probably underreported due to a variety of reasons, among which, for instance, are burial requirements and illegitimacy.

Race in this report is used to distinguish among White, Black, Puerto Rican and Other. The basis is the response of the mother (for births) and other informants (for deaths). When reference is made to White and Non-white (Table 9), the Non-white category is made up of the total minus the Whites.

The label 'race' is unsatisfactory because of its various connotations. A more meaningful term would be 'ethnicity,' because it is a better index of patterns of living with which it is desirable to relate vital events. However, until a satisfactory means of distinguishing ethnic groups has been established, race will have to suffice.

INTERPRETATION OF DATA

Population

In April, 1970, the decennial count of persons throughout the nation was conducted by the United States Bureau of the Census. While the federal censuses are regarded as providing the most complete and reliable population information, their utility is limited when periods of less than ten years are to be used as the units of time. Inter-decile population reports are issued by the Commonwealth, but the state's definition of who is to be counted as a Massachusetts resident has differed from the federal definition, thereby diminishing the comparability of the federal and state census data. Estimates of population for individual years are readily found, also; but the particular technique of estimation from among the several available seldom if ever is cited, and therefore absolute comparability of data is denied.

These objections may preclude conclusions dependent upon strict comparability of units. However, if the purpose of their consideration is to indicate trends, with no explicit or even implicit claim of absolute truth, then the use of the different population counts may be permitted. That is what has been done in computing the birth, death, and infant mortality rates for the half-century 1920-1970 and presented graphically in Figures 1, 2, and 3. These data are presented to illustrate the contrast in constancy of births and deaths in our society and the effects of continuing efforts to improve infants' chances for survival during their first year of life.

BIRTHS, DEATHS, AND INFANT MORTALITY

AMONG MASSACHUSETTS RESIDENTS

1920-1970

<u>YEAR</u>	<u>BIRTHS</u>	<u>RATE</u>	<u>DEATHS</u>	<u>RATE</u>	<u>INFANT MORTALITY</u>	<u>RATE</u>
1920	91,859	23.8	53,632	13.9	8382	91.2
1925	86,014	20.8	51,890	12.5	6294	73.1

Births

Chapter 358 of the Legislative Acts of 1968 of the Commonwealth of Massachusetts provides for a new multiple-copy birth certificate. One copy of the new certificate has a confidential section added to the legal section. This copy is sent directly to the Department of Public Health. The legal record includes: date of record information; place of birth; name and sex of the child; names, places of birth and residences of the parents, including the maiden name of the mother; and occupation of the father. The new confidential section contains information regarding congenital malformations, if any, of the baby, the baby's weight, and history of previous deliveries; in addition, a 10 per cent sample (babies born on the 5th, 15th, and 25th of the month) provides data on gestation (date of last normal menses), prenatal care (month of first visit and total number of visits), complications of labor and delivery, and birth injuries. This information is available on magnetic tape for analyses, although no such detailed studies are reported in this general report of vital statistics.

The most notable fact regarding births to Massachusetts residents in 1971 was the remarkable decrease in the number. Whereas the number of resident births increased by 1.3 per cent from 1969 to 1970, the total of 86,755 in 1971 was 9.3 per cent fewer than the 93,582 in 1970. However, Massachusetts was not unique in this respect; for the nation as a whole births increased 3.6 per cent between 1969 and 1970 but then decreased an estimated 9.6 per cent during the next year.

Deaths

Approximately every ten years the World Health Organization revises the International Classification of Diseases, and 1969 was the first year in which the Eighth Revision was used in the Massachusetts Annual Statistical Report. A discussion of the major classification changes can be found in the Eighth Revision International Classification of Diseases, Adapted for Use in the United States (Public Health Service Publication No. 1693, United States Government Printing Office). Researchers should recall that while this new classification, by itself, may not effect major changes in findings from mortality tabulations, the rules used for assigning the underlying cause of death were also revised. Thus, if a researcher finds an unexpected change in the frequency of a specific cause of death compared with prior years, he should inquire into how much the observed change is due to the effects of the revised classification and rules for assigning the underlying cause of death.

In Massachusetts, as in the nation, the major underlying cause of death has shifted over the past several decades from infectious diseases (tuberculosis, pneumonia, influenza, etc.) to chronic and degenerative illnesses (heart disease, cancer, etc.).

A look at the frequencies of death among whites and blacks by age groups (Table 11) reveals a statistically significant difference between the two ethnic groups. Below the age of 60 years more blacks die than would be expected by chance; over age 60, fewer blacks die than should be expected (See Figure 4). The median age at death for blacks in Massachusetts in 1971 was 58.1 years, while that for whites was 72.8 years.

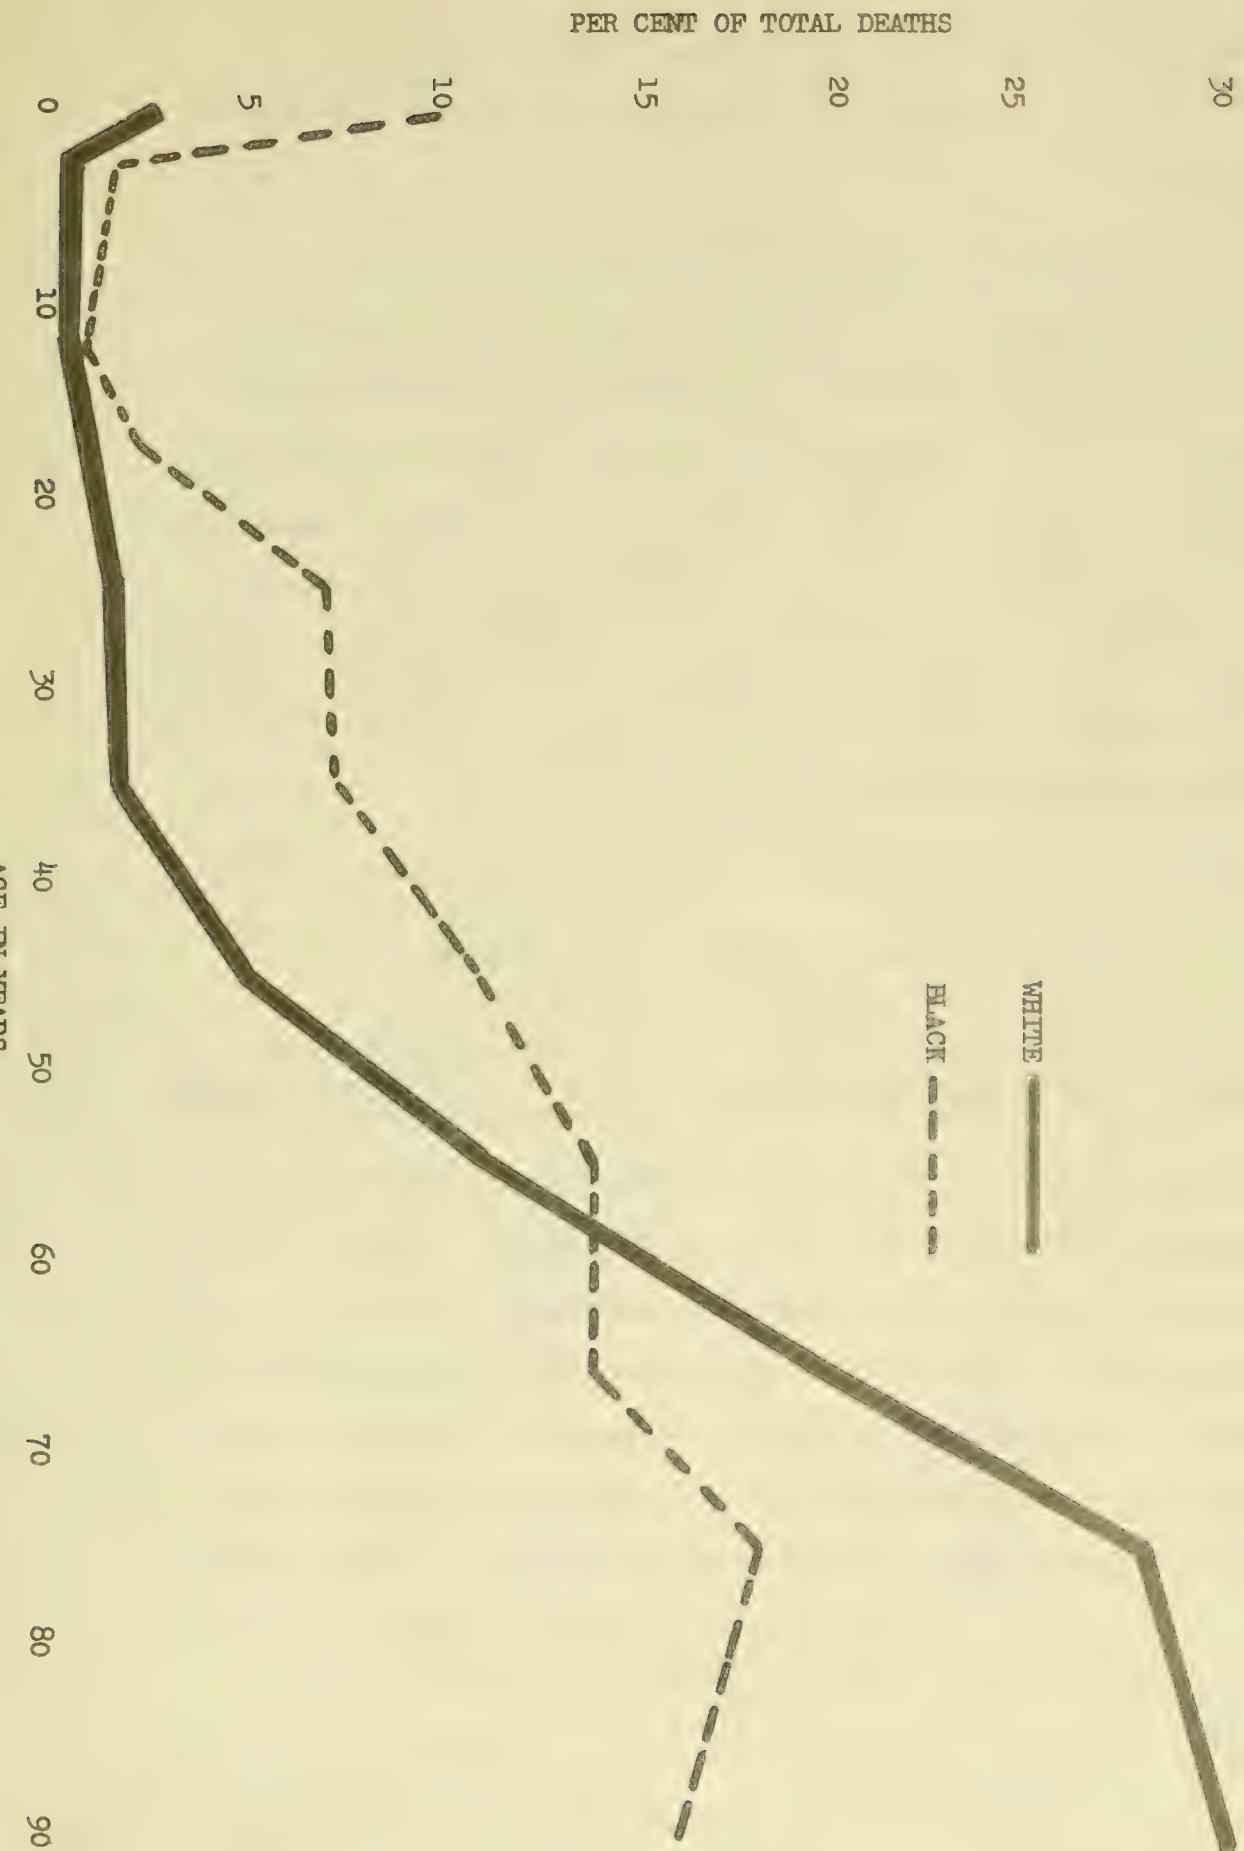

Further examination of the causes of death in the two groups shows that among whites of age 15 to 29 years motor vehicle accidents took a particularly high toll; among blacks of 20 to 39 years, homicides accounted for a disproportionate number of deaths. These differences may be due to more social and economic than physical differences in life-styles. However, interesting differences in medical causes of death appear among the older persons. Among whites ischemic heart disease killed a considerably higher proportion of whites than blacks during their productive years of 30 to 69. Among older blacks (60 years plus) diabetes mellitus stands out as a cause of death much more so than among whites of that age.

Marriages

There were 47,535 marriages in Massachusetts in 1971, an increase of 243 from the preceding year. The median age of the brides was 22.5 years and that of the grooms was just slightly greater, 22.8 years. As in 1970, March was the month for the least number of marriages (2147), while June was still the month of choice, the 6042 marriages being 75% more than the average for the other eleven months.

FIGURE 4

1971 DEATHS OF WHITES AND BLACKS
Per Cent of Total by Age Groups

Divorces

When a divorce is granted by a Massachusetts court, there is a six-month waiting period before the divorce is finalized. Prior to 1969, divorces were reported when the court reached its decision. This resulted in over-reporting when, due to a change of mind of the partners or to the death of one of them, not all divorces became final. Beginning in 1969, divorces were reported only when finalized. This change will undoubtedly produce more precise data. The following table summarizes the number of finalized divorces that occurred in each Massachusetts county in 1971.

DIVORCES AND ANNULMENTS IN MASSACHUSETTS

GRANTED BY COUNTY

<u>County</u>	<u>Divorces</u>	<u>Annulments</u>	<u>County</u>	<u>Divorces</u>	<u>Annulments</u>
Barnstable	274	0	Hampshire	304	7
Berkshire	416	1	Middlesex	2706	25
Bristol	1169	16	Nantucket	8	2
Dukes	24	0	Norfolk	1163	17
Essex	962	14	Plymouth	844	12
Franklin	186	4	Suffolk	1718	16
Hampden	1383	31	Worcester	1560	19

State total: 12,717 divorces; 164 annulments

There has been a general increase in the number of divorces granted between 1969 and 1971, as indicated in the following:

PER CENT CHANGE IN DIVORCES

BY COUNTY

<u>County</u>	<u>1969-1970</u>	<u>1970-1971</u>	<u>County</u>	<u>1969-1970</u>	<u>1970-1971</u>
Barnstable	37.1	-12.7	Hampshire	30.4	14.3
Berkshire	29.3	10.9	Middlesex	-39.0	89.8
Bristol	9.0	16.8	Nantucket	-80.0	166.7
Dukes	-9.5	26.3	Norfolk	0.3	26.6
Essex	22.2	-17.1	Plymouth	12.0	4.3
Franklin	13.4	15.5	Suffolk	12.6	2.0
Hampden	16.6	9.8	Worcester	6.4	9.7
State	1.5	17.6			

The data which come to the Department of Public Health from the courts are abstracted from the court records and do not include detailed information with regard to the families (number of children involved, for example). One bit of information recorded is the duration of the marriage before the divorce; in 1971 marriages ended at the behest of the wife had lasted an average of 9.8 years, while those for which the husband was granted the divorce had continued one year longer (average=10.8 years). Annulled marriages were of much shorter duration, as would be expected. The difference in length-of-marriage preceding annulment was again one year: 2.5 years for women and 3.4 years for men.

It should be noted again that the number of divorces granted in other states to Massachusetts residents is not known; no system of exchange of such information among the states has been established.
